Updating the Remote Storage Application configuration

In the updated Azure web app version of the Remote Storage Application (currently used for PSBs; will deploy to production IZs soon), configurations (including storage locations for all IZs) are stored on the sftp server at sftp.wrlc2k.wrlc.org in a file named conf.json.

The PSB config.json is found at:

PSB: /home/scfapp/AlmaRSA-PSB/conf.json

You'll need to be at WRLC HQ or on the WRLC VPN to update conf.json.

To make updates to the PSB config file, use an FTP client such as FileZilla to download conf.json to your local computer. Then make your desired changes and re-upload it to the same location via FTP.

Once the PSB config file is updated on the server, it must be loaded into the Remote Storage Application by visiting the following the URL:

PSB: https://wrlc-alma-remote-storage.azurewebsites.net/configuration

You can then check the Remote Storage Application's log files to verify that the conf file loaded successfully.

This page will be updated with additional file information once the web app is deployed to production IZs.
